

# Java Script

## Java Script and HTML

# Example

2

- Create an Java script function that add «changed» string to the all the text input tags

# Lab

Patient Id:

Add

Change

First Last Name:

Query

Delete

Doctor Name:

Patient Info

| Id | First Name | Last Name | Doctor Name |
|----|------------|-----------|-------------|
| 1  | Ahmet      | Ak        | Kemal Mor   |
| 2  | Ayşe       | Yeşil     | Kemal Mor   |
| 3  | Mahmut     | Sarı      | Fatma Mavi  |

Create a patient object.

Add patients to the javascript array.

When you click Add, add the patient first to the array and then to the table.

When you press the query, show the doctor's patients.

If no doctor is selected all patients should come.

Press the Delete button to delete the selected Patient (from the arraylist and screen).

Press Change to make the selected patient's doctor the chosen doctor.

Add a fee to the doctor class. Add payment to the patient class.

Show patients with less than one payment in a listItem.
